

Edged Out

Spatial Mismatch and Spatial Justice in South Africa's Main Urban Areas

Research Dissemination Conference

30 August 2017

Outline

- Research questions and motivation
- What is spatial mismatch, why might it be important in South Africa?
- Methodology of our investigation
- Results
- Understanding the resilience of Apartheid cities
- Policy implications
- Implications for understanding Spatial Justice
- Conclusion

Research questions

- How important is housing location for people's employment prospects in SA's main urban areas?
- What are the implications for housing policy which aims to address poverty?
- What are the implications for how we understand spatial justice in South Africa's cities?

Research motivation

- SA cities have particular Apartheid spatial form
- Much of post-Apartheid housing delivery has focused on unit delivery, with consequences of entrenching peripheral development
- Popular and academic recognition of importance of housing location, increasingly in govt policy
- In particular there is now assumption about Spatial Mismatch Hypothesis
- But very little work seeking to investigate or quantify Spatial Mismatch and its impact

Context

1. South African cities characterised by Apartheid-era spatial forms
 - Extreme racial and class segregation; black and working class people live in peripheral and poorly-serviced areas
 - Apartheid city density patterns are dysfunctional and regressive
 - This spatial form is the result of deliberate Apartheid policy
2. South Africa has widespread poverty and extreme inequality
 - Dysfunctional labour market is main cause of high poverty and inequality
 - Low wages (except at the top) and high unemployment
 - Poverty and labour market outcomes are highly racialised
 - People stuck in inter-generational poverty due to variety of “poverty traps”

The Spatial Mismatch Hypothesis

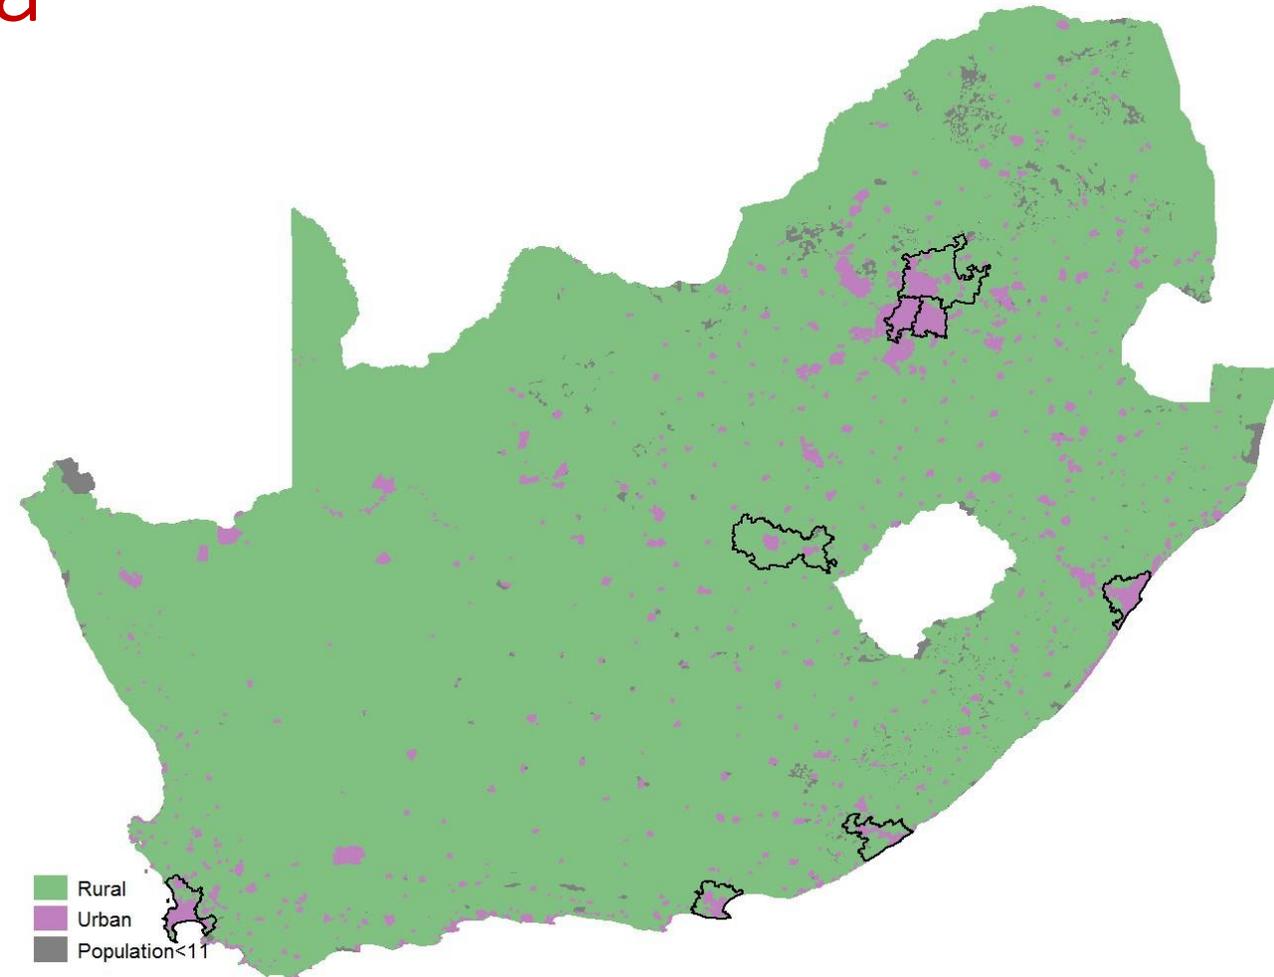

- The SMH provides one theoretical link between city structure and high unemployment (and poverty)
SMH: living far away from jobs makes it difficult for people to find Employment
- Statistical methods for testing for Spatial Mismatch developed in USA
- SM determines whether areas/people far from jobs have higher unemployment rates
 - While controlling for the effects of other factors unrelated to distance
- Spatial mismatch has political, policy and economic implications – its how the poor stay poor

Spatial Mismatch in South Africa's cities

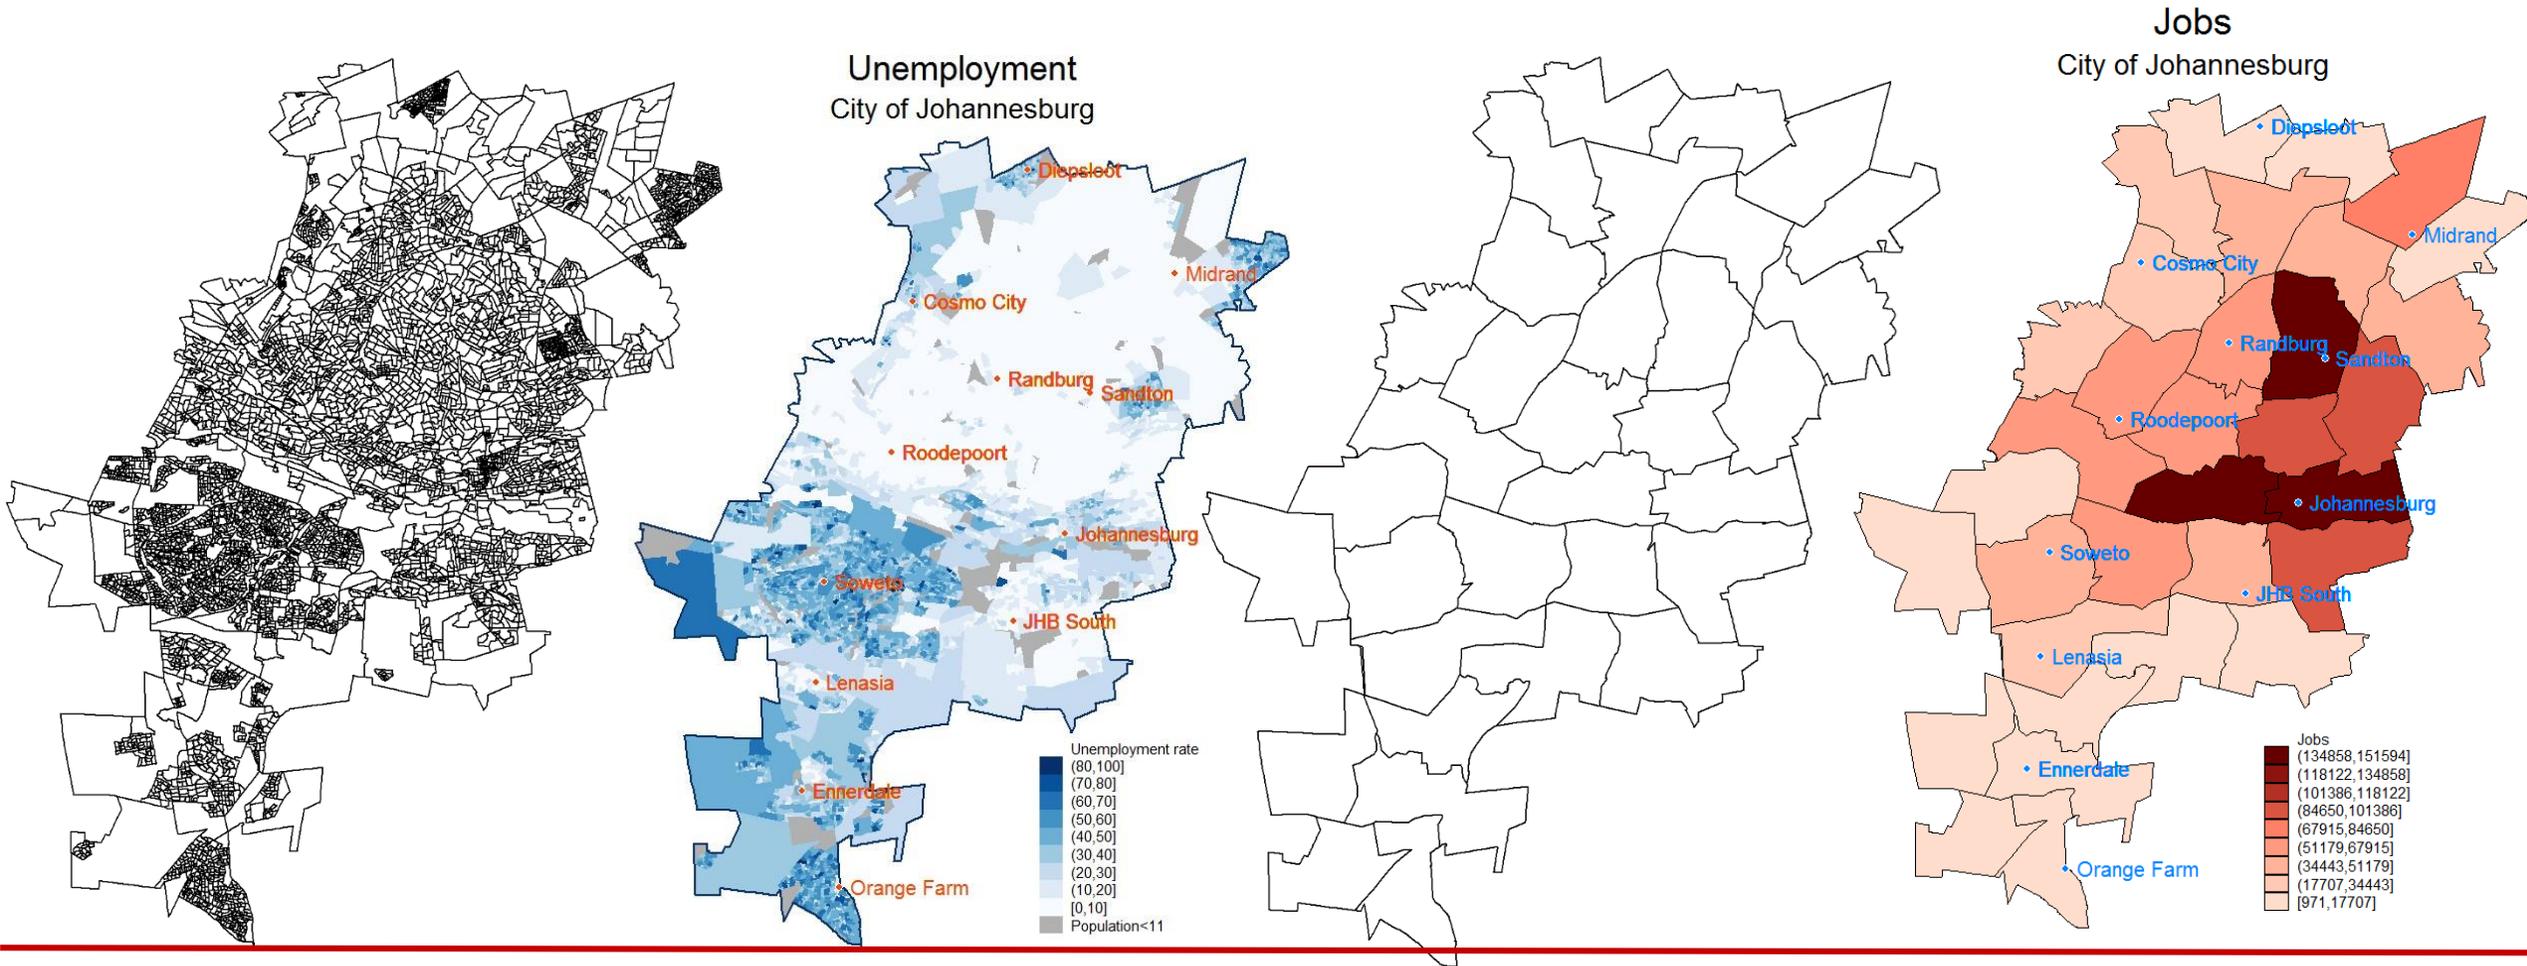

- Spatial mismatch exists in narratives
- Strong qualitative and descriptive work shows poor people live far from jobs
- But only 2 studies statistically investigate whether there is a relationship between housing location and unemployment:
 - Rospade and Selod (2006) provide evidence for spatial mismatch in CPT
 - Naude (2008) provides evidence of spatial mismatch in SA's metros as a whole
- However some drawbacks for policy and political purposes:
 - No discussion of **size** of spatial mismatch effect
 - Limited geographic scope
 - Somewhat dated
- This motivated the research

Rsearch scope and data

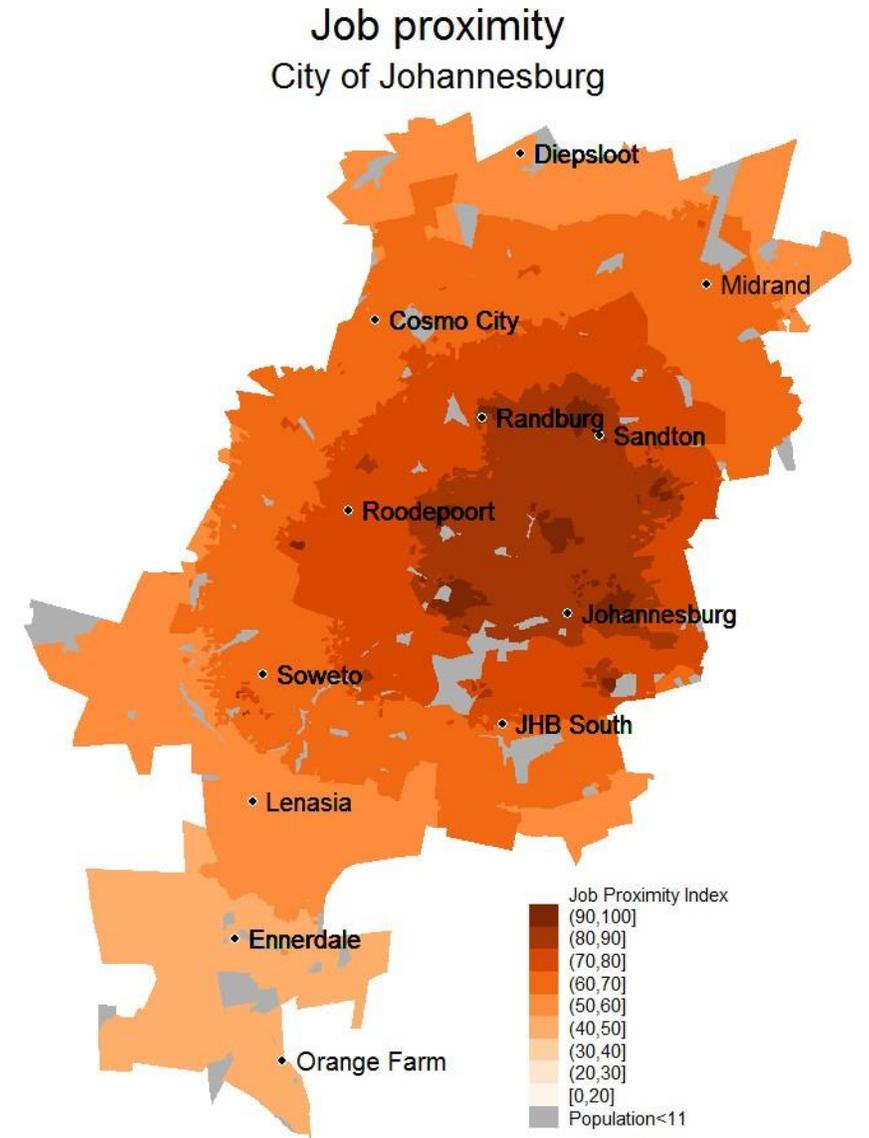

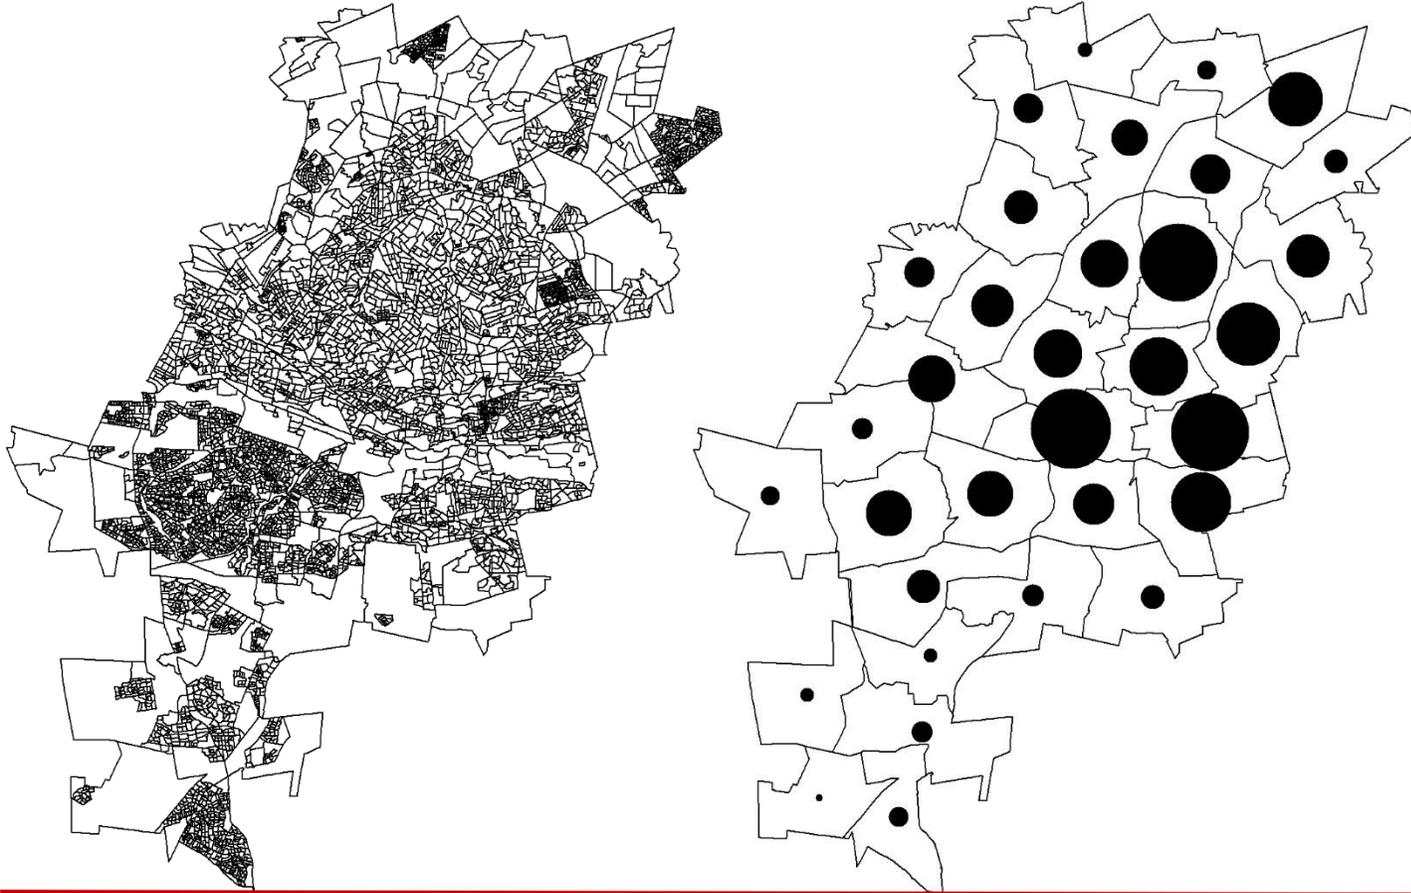

- 8 metropolitan municipalities
- And two larger areas: Gauteng Province and “Johannesburg-Ekurhuleni-Tshwane” (JET)
- Two data sources:
 - Census data (unemployment rates and demographic characteristics)
 - Jobs location data (from the CSIR)

What does the data look like?

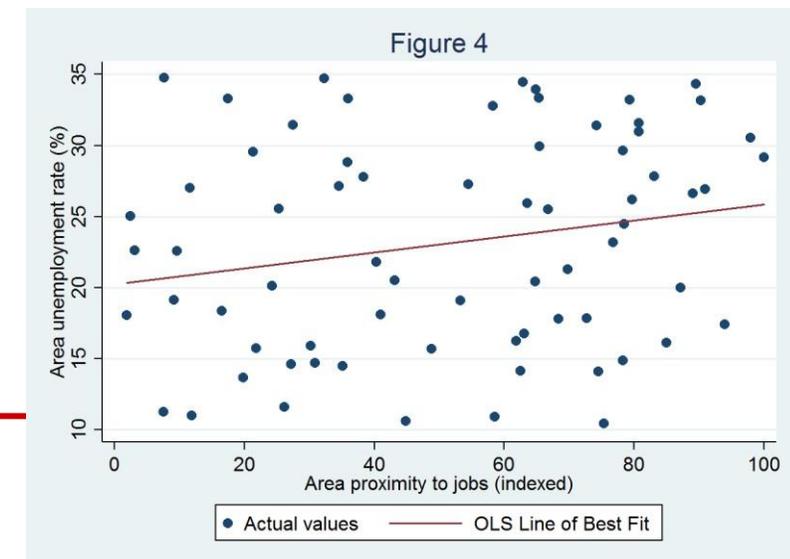

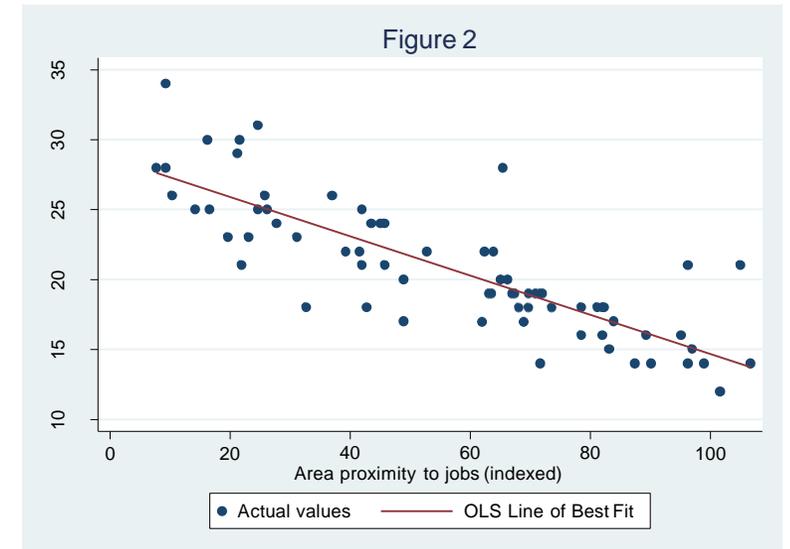

A proximity to jobs index

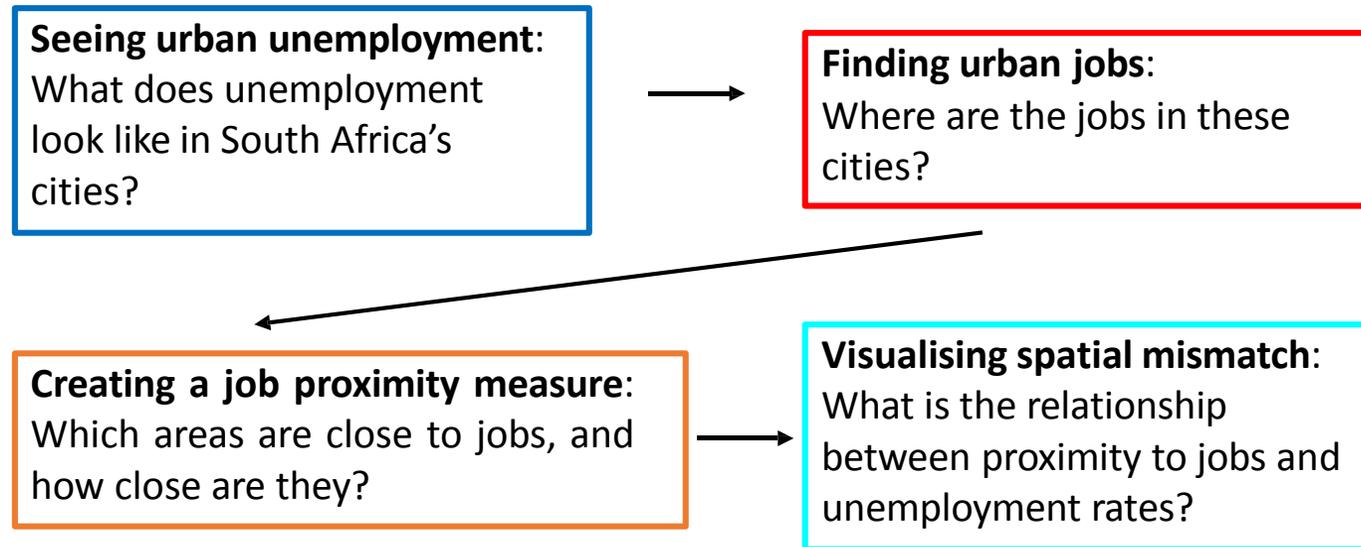

Regression analysis..

- Method for quantifying statistically the observed relationship between phenomena
- Basically draws a line-of-best-fit through our data, so we can see an overall relationship
- Real power of regression analysis is when we have many variables (*multiple regression*)
 - We can control for “confounding factors”
 - Changes interpretation of our estimates
- Line-of-best-fit relationships not always *statistically significant!*
 - Unreliable data/small sample/very small effect

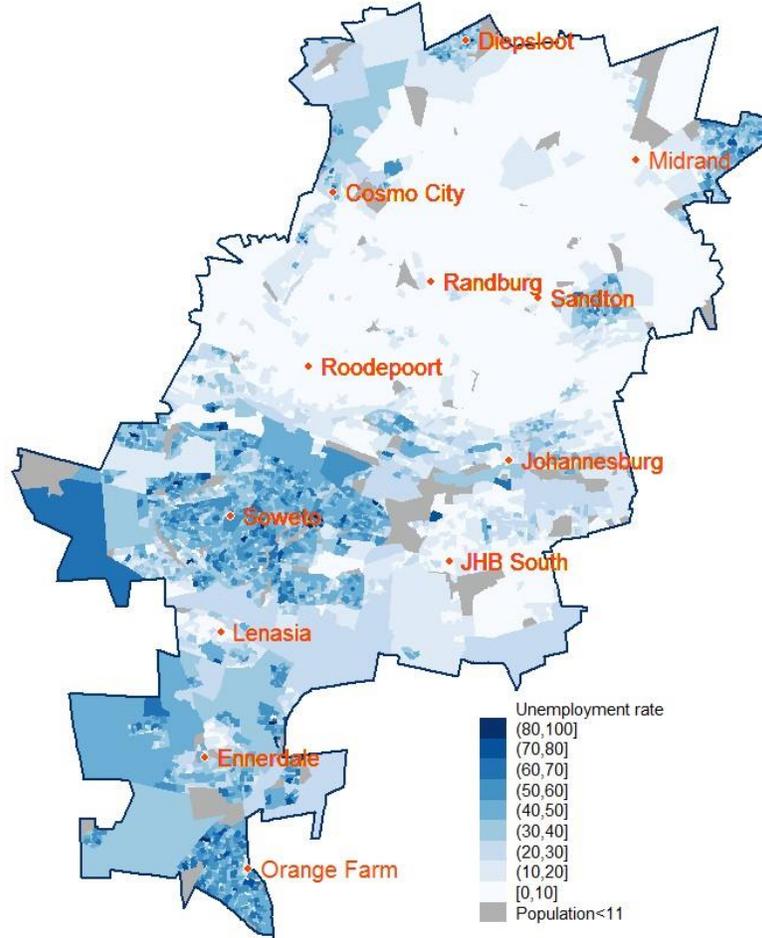

Looking for spatial mismatch

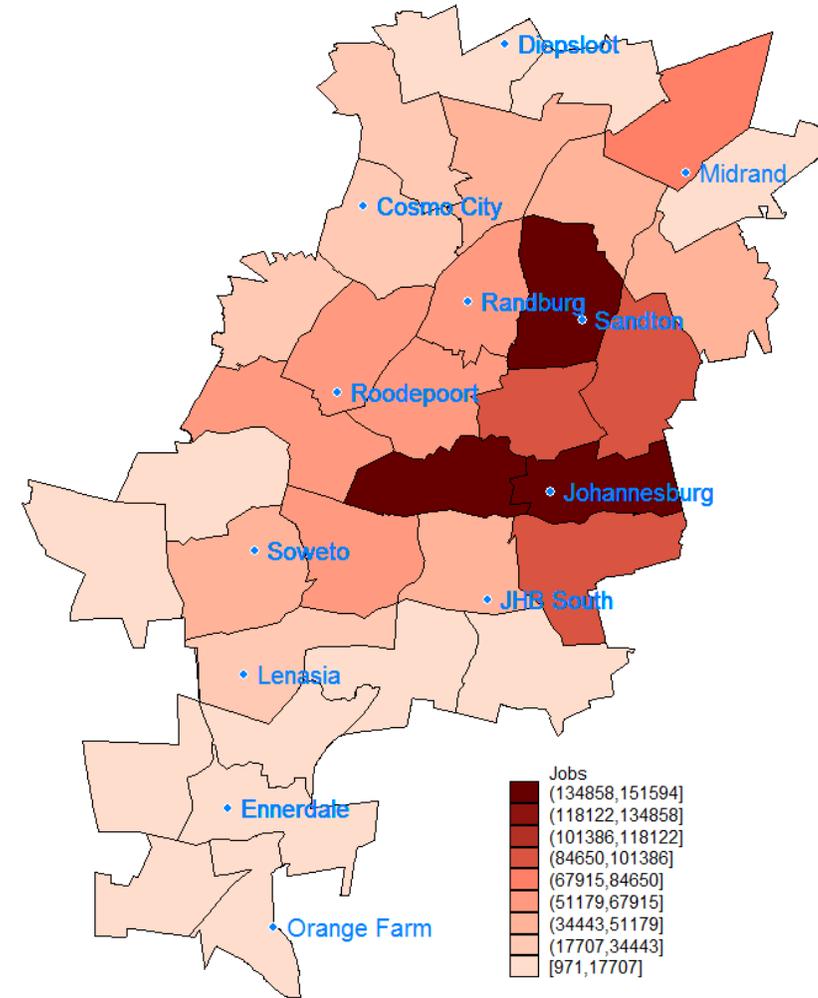

- We regress small area unemployment rates on “proximity to jobs” scores
 - While controlling for (at small area level): % white, % female, % urban, mean age, mean age squared, and total small-area population

Why the resilience of Apartheid cities?

- Commercial developers have generally sought to invest in well-located city cores and suburbs
 - Even supposedly low-cost private sector housing is typically unaffordable for the poor
 - Government has been unable to effectively direct private investment
- Post-Apartheid housing policy has tended to entrench peripheral development
 - Emphasis on titling, freehold tenure, “asset-based” pathway out of poverty
 - But RDP housing has not been an effective financial or productive asset
 - RDP housing not bad! But *peripheral* RDP housing entrenches Apartheid spatial form

Implications for housing policy

- Intensive rather than extensive development
 - Spatial Mismatch shows dangers of exacerbating urban sprawl and entrenching development of peripheral dormitory settlements
 - Mega-projects, based on idea of taking “jobs to housing”, are implausible, risky, costly, and do not take advantage of the “urban premium”
- Prioritising well-located affordable housing
 - In the inner city, where Joburg evidence suggests severe shortages
 - Beyond the inner-city: suburbs, and ensure the affordability of Corridors of Freedom-type projects
 - Building a public sector rental option

Implications for understanding Spatial Justice?

- Strong commitment made to the concept of Spatial Justice in SPLUMA and the NDP
- Potential to be politically powerful, but practical definitions lacking
 - Academic definitions suggest spatial justice is about identifying the inter-relationships between spatial conditions and social outcomes, and vice versa
 - Government definitions emphasise “righting the wrongs of the past”
- In either case, spatial mismatch is a clear example of spatial injustice!
- Creates a benchmark for evaluating one aspect of progress to spatial justice in SA’s cities
- Of course spatial justice is about more than spatial mismatch! But this offers one important issue to benchmark against and mobilise around.

Conclusions

- South African cities characterised by Apartheid spatial form, and extreme poverty and inequality
- Evidence suggests spatial mismatch is one way in which these phenomena are linked
 - Has large impact in most of SA's major urban areas
 - This is despite our measure being somewhat crude and probably biased against picking up mismatch
- Some policy implications: peripheral housing mega-projects are bad, well-located affordable housing is good
- Ideas of spatial justice must mean integrated cities with proactive measures to include poor & working class in well-located & serviced areas
